

Credencing Classroom Exercises

Short exercises for teaching calibrated confidence, Bayesian movement, and motivated override.

Exercise 1: Confidence Scaling

Give students ten ordinary claims and ask for confidence ranges rather than yes/no answers.

- Discuss which claims invited fake certainty.
- Ask what evidence would move each estimate.

Exercise 2: Base Rates

Present a vivid case and a background frequency. Have students estimate before and after seeing the base rate.

- Identify where vividness distorted EP.
- Compare individual intuitions with group averages.

Exercise 3: Core vs Deep Failure

Give two cases with similar final confidence but different causes.

- One case should involve missing statistical tools.
- One case should involve motivated refusal.
- Ask which repair fits each case and why.

Exercise 4: Prediction Log

Have students make five 70 percent predictions and revisit them later.

- Count calibration instead of rhetorical confidence.
- Discuss how it feels to be uncertain in public.
