

# Credencing One-Page Guide

A compact guide to the E0 -> EP -> CA model and the distinction between Deep Rationality and Core Rationality.

## The Three Anchors

Credencing maps the relation between evidence, perception, and final confidence.

- E0: Objective Evidence, the support in the world.
- EP: Perceived Evidence, what the agent takes the evidence to show.
- CA: Assigned Credence, the confidence the agent actually adopts.

## The Two Gaps

The model distinguishes misperceiving evidence from refusing one's own perceived evidence.

- Calculation Error (DE): the E0 to EP gap.
- Core Irrationality (IC): the EP to CA gap.
- Deep Rationality (SD): the skill used to process evidence.

## Use Question

When judging a belief, ask where the gap opens before assigning blame.

- Is the person missing information or tools?
- Is the person protecting identity, fear, status, or tribe?
- What evidence would rationally move the credence?
